## DISASSEMBLY

### PREAMP REPAIRING

1. Remove the screws fixing the rear panel to the chassis.
2. The set can be disassembled as shown.
3. After repairing, assemble the set taking care of the rotary switch position.

\* Refer to Destinations' parts list.

### POWER AMP REPAIRING

1. Remove the screws fixing the heat sink to the chassis.
2. Remove the mini-connector of the power amp unit.
3. Pull out the power amp unit from the top side of the set and assemble it as shown.

# DIAL CORD STRINGING/BLOCK DIAGRAM

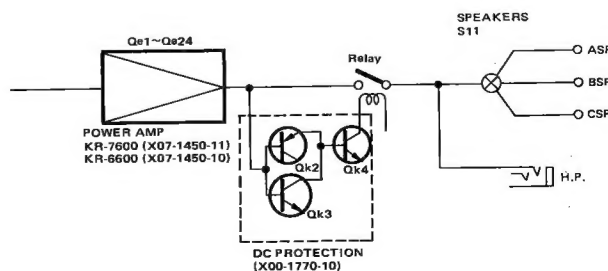

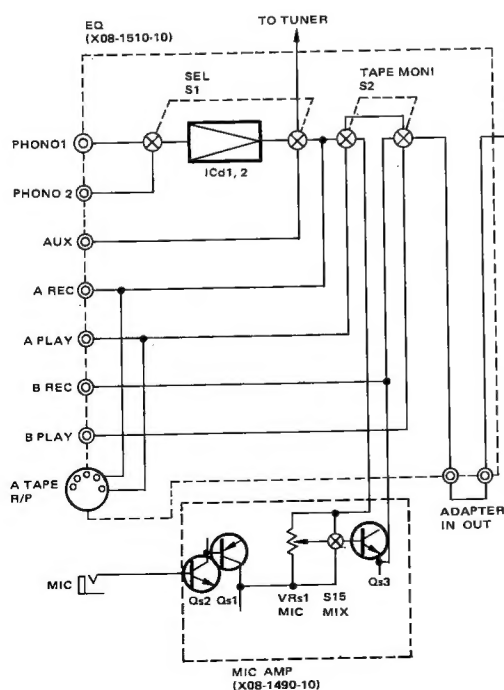

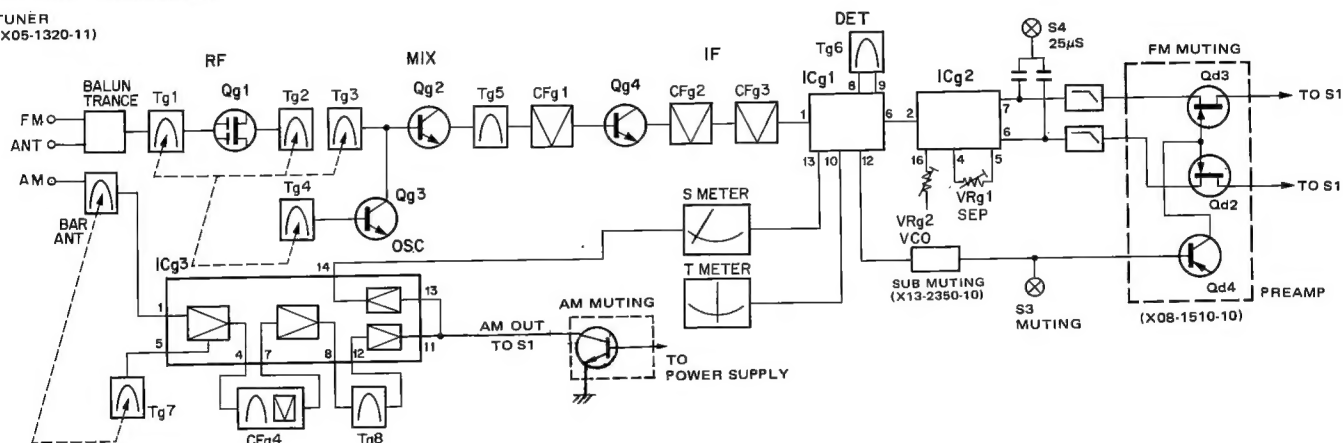

## DIAL CORD STRINGING

1. Fully open the variable capacitor.
2. Fix the dial pulley to the shaft of the variable capacitor using 2 screws as shown.
3. Tie the dial cord to the boss A.
4. Dress the dial cord in the direction of "1" to "2".
5. Wind the dial cord 3 turns around the dial shaft starting from its lower side, then dress it in the direction of "3" to "7".
6. Wind the dial cord 2 turns and a half around the dial pulley starting from its lower side and tie it to the boss B.
7. Fully close the variable capacitor.
8. Mount the dial pointer as shown in the illustration.

# CIRCUIT DESCRIPTIONS

## FM RF

Qg1: MOS-FET, RF amp    Dg1: Limiter  
 Qg2: Mixer                Dg2: Popping-noise elimination for AM-FM switch-over  
 Qg3: Local oscillator    Dg3: Reverse current prevention  
 Qg4: IF amp

## IF CIRCUIT

The IF circuit employs IC HA1137W in which quadrature detector circuit, muting circuit, and meter circuit are incorporated. (See block diagram.)

Quadrature detection is a sort of phase detection. A signal from the third IF AMP is directly applied to one side of input circuits of the multiplier of quadrature detector, and another signal is applied to the other side through the phase shifter of Tg6. The variable in phase difference obtained from these two signals is utilized for detection.

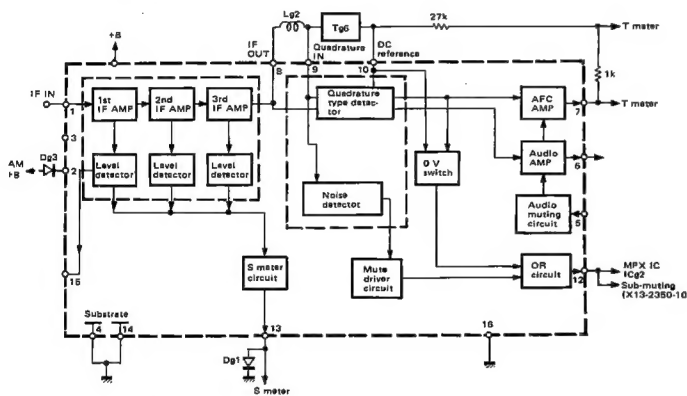

Fig. 1 HA1137W BLOCK DIAGRAM

## FM MUTING CIRCUIT

The FM muting circuit employs Qd2 (Qd3) of the pre-amplifier unit as a switching element. The operating voltage for muting is taken out of the muting circuit within the IC.

### —DETECTION PROCEDURE—

Intensity of input level is detected from a position where a signal equivalent to the quadrature detection input is obtainable (NOISE DETECTOR). The obtained signal is supplied to the MUTE DRIVER CIRCUIT. On the other hand, DC output (discrimination curve) of the quadrature detector is fed to the 0V SWITCH and output is generated as shown in Fig. 2-(a). This output and above-mentioned input level detecting signal are put in the OR CIRCUIT, thus generating an OR output as shown in Fig. 2-(c).

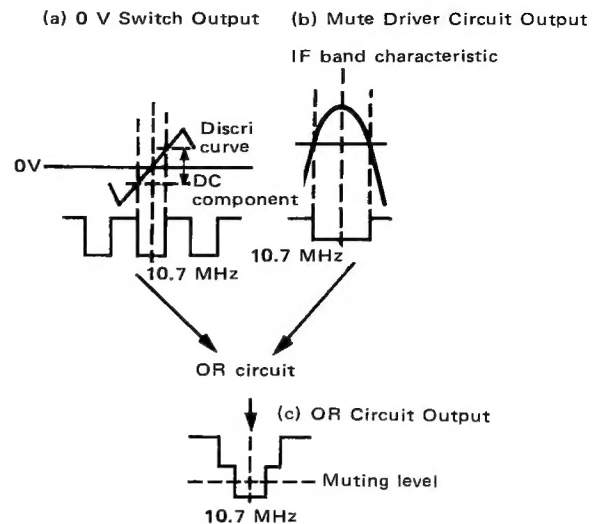

Fig. 2 HA1137W MUTING DETECTION

Namely, when the input signal is weak or deviates from the discrimination curve of the FM detector, operating voltage for muting is generated exceeding the muting level. (The muting start level corresponds to the antenna input below  $8\mu\text{V}$ .) This operating voltage is processed for wave-form trimming at the Schmidt circuit of the SUB-MUTING unit (X13-2350-10) and then used as a trigger signal for ON-OFF switching of Qd4. Muting start voltage  $\rightarrow$  Qp2: ON  $\rightarrow$  Qp1: OFF  $\rightarrow$  Qd4: OFF

When S3 is ON (Qd4: OFF), FM +B is directly applied to the gate circuit of FET Qd2 (Qd3) and FET is switched on (FET turned on). When Qd4 is ON, gate voltage of Qd2 (Qd3) is lowered and FET is switched off (FET turned off). When S3 is OFF, +B is always maintained at the gate circuit of FET which is therefore turned on. This operating voltage for muting is also applied to terminal No. 12 of MPX IC (the forced MONO circuit) for the prevention of misoperation of ST lamp.

Fig. 3 DETECTION PROCEDURE

## FM-MPX

The FM-MPX circuit employs newly designed MPX IC, HA1196. (See block diagram.) Compared with conventional HA1156, the distortion factor is very low. VCO is adjusted to 76 kHz. For FM dolby broadcast, the de-emphasis circuit is switched over to  $25\mu\text{sec}$  (S4).

# CIRCUIT DESCRIPTIONS/TROUBLESHOOTING

## AM TUNER

The exclusively designed IC HA1151 is adopted. In this circuit, Qd1 is used for the prevention of shock noise which occurs at time of switching on in AM setting.

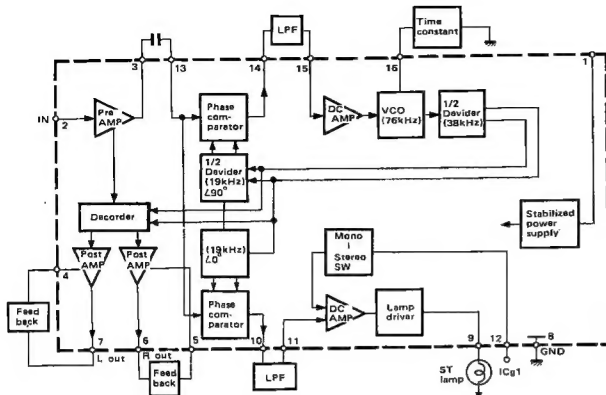

Fig. 4 HA1196 BLOCK DIAGRAM

## PROTECTION

1. ASO detection protection: Power AMP Qe9~Qe16
2. DC protection: Power supply Qk2~4

When DC voltage is generated at the power amplifier, the relay is released and the output circuit is cut off. Qk3 is turned on when + voltage is generated, while Qk2 is turned on when - voltage is generated. When either one is turned on, Qk4 is turned off and the relay is released.
